

Task 7 :Identify and Remove Suspicious Browser Extensions

Objective: Learn to spot and remove potentially harmful browser extensions.

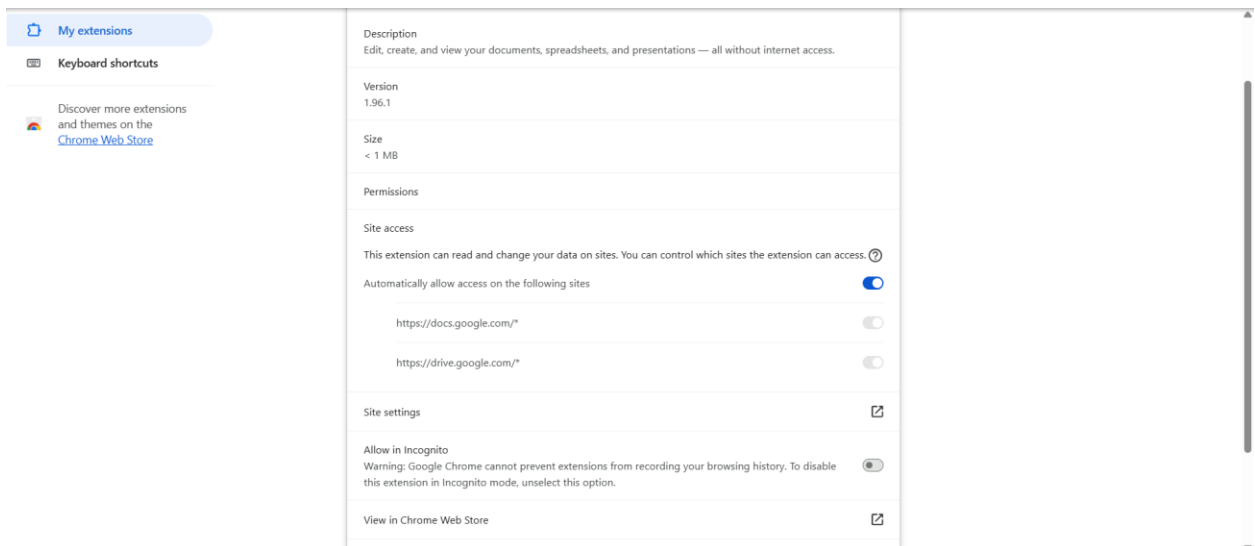

- **1. Open Extension Manager**
- Launch your browser (e.g., Chrome, Firefox, Edge).
- Go to the **extensions/add-ons manager**:
 - Chrome/Edge: `chrome://extensions/`
 - Firefox: `about:addons`

- **2. Review Installed Extensions**
- Look at the full list of installed add-ons/extensions.
- Note down names, publishers, and version numbers.

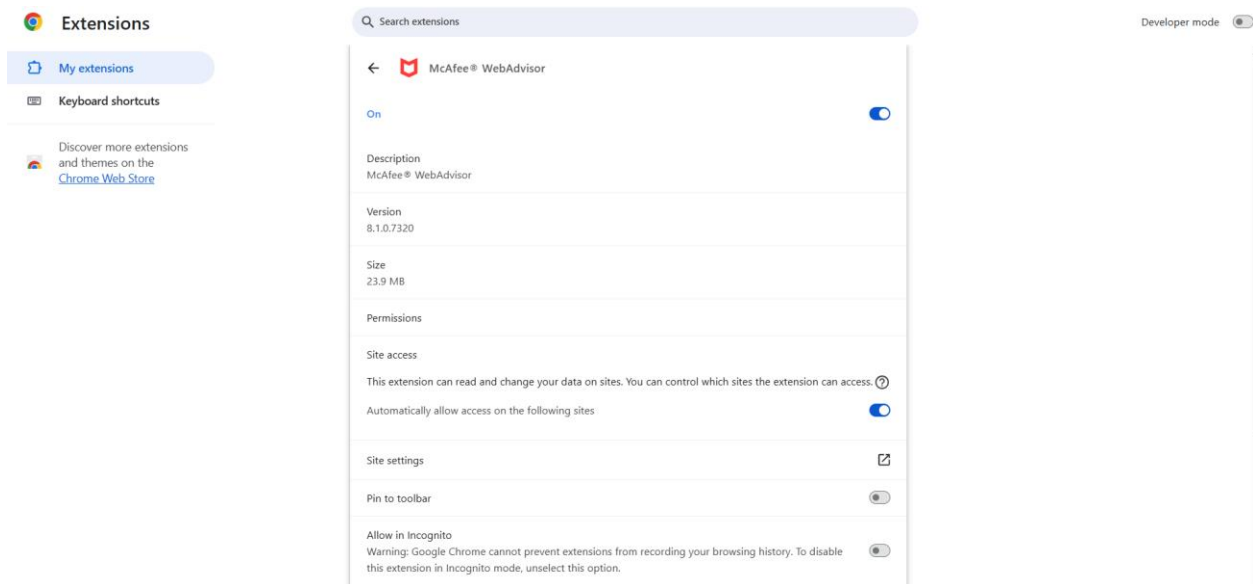

- **3. Check Permissions & Reviews**
- See what permissions each extension requests (e.g., access to browsing data, tabs, cookies).
- Look up user reviews and ratings in the Chrome Web Store/Firefox Add-ons store.

- **4. Identify Suspicious Extensions**
- Mark any extensions that:
 - You don't remember installing.
 - Have vague/untrustworthy publishers.

- Request unnecessary permissions.
- Have poor or no reviews.

- **5. Remove Suspicious or Unused Extensions**
- Disable or uninstall unnecessary/unfamiliar extensions.
- Keep only trusted and essential ones.

- **6. Restart Browser & Test Performance**
- Close and reopen the browser.
- Check for speed, reduced ads/pop-ups, or smoother performance.

• **7. Research Risks of Malicious Extensions**

- Malicious extensions can:
 - Track browsing habits and steal personal data.
 - Inject ads, redirect traffic, or install malware.
 - Capture keystrokes (password theft).

- Exploit permissions to access emails, files, or financial info.
- **8. Document Findings**
- Record which extensions were kept, removed, and why.
- Example:
 - Removed: *XYZ Downloader* – unknown publisher, requested access to all sites.
 - Kept: *Grammarly* – verified publisher, necessary for writing assistance.
